

IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) A device having a first and a second sound-generating means and an input for a stereo signal comprising left and right sound signals, wherein the device has an interconnected first and second part comprising the first and the second sound-generating means, respectively, the first part being formed so as to couple soundwaves generated by the first sound-generating means into a surface when said device ~~is~~ placed upon said surface, and wherein the device has means for sending a first signal, being a first composite of the left and right sound signals, to the first sound-generating means of the first part, and a second signal, being a second composite of the left and right sound signals different from said first composite, to the second sound-generating means of the second part.

2. (Withdrawn) A device having a first and a second sound-generating means and an input for a stereo signal comprising left and right sound signals, wherein the device has an interconnected first and second part comprising the first and the second sound-generating means, respectively, the first part being arranged to couple soundwaves generated by the first sound-generating means into an outer envelope of the first part, and wherein the device has means for sending a first signal, being a first composite of the left and right sound signals, to the first sound-generating

means of the first part, and a second signal, being a second composite of the left and right sound signals different from said first composite, to the second sound-generating means of the second part.

3. (Withdrawn) A device having a first and a second sound-generating means and an input for a stereo signal comprising left and right sound signals, wherein the device has an interconnected first and second part comprising the first and the second sound-generating means, respectively, the first part being formed so as to couple soundwaves generated by the first sound-generating means into an elongated element coupled to the first part, and wherein the device has means for sending a first signal, being a first composite of the left and right sound signals, to the first sound-generating means of the first part, and a second signal, being a second composite of the left and right sound signals different from said first composite, to the second sound-generating means of the second part.

4. (Previously Presented) The device as claimed in claim 1, wherein the means for sending is arranged in such a way that the first signal and the second signal are substantially orthogonal signals.

5. (Previously Presented) The device as claimed in claim 4, wherein the means for sending is arranged in such a way that the

first signal comprises a difference signal of the left and right stereo signals, and the second signal comprises a sum signal of the left and right stereo signals.

6. (Previously Presented) The device as claimed in claim 1, wherein the first part comprises coupling means for coupling the first part to the surface.

7. (Previously Presented) The device as claimed in claim 6, wherein the coupling means comprises a suction element.

8. (Previously Presented) The device as claimed in claim 6, wherein the coupling means comprises a magnet.

9. (Withdrawn) The device as claimed in claim 3, wherein the first part and the elongated element are coupled by reversible coupling means.

10. (Previously Presented) The device as claimed in claim 1, wherein the first sound-generating means comprises a piezo-element.
